

Product Options:

- **Pro-Plus Package:** If you are looking to purchase a trench box, we strongly urge you to consider the Pro-Tec Pro-Plus Package.
- Pro-Plus Package consists of 3 main components to make your trench box stronger and give it added durability for added life.
 1. Standard spreader collars in the industry consist of 1/2" thick wall collars. We make these collars 3/4" thick.
 2. Double outside end posts which add strength & protection from bucket damage on the front & rear of the trench shield.
 3. 1/2" x full length push pad – attached to the top of the trench shield, the push pad provides an extra layer of protection from bucket damage. (Want to make this push pad thicker or longer only in certain locations on the top of the trench shield? No problem. We will build it to put push pads in any location & thickness you may need.)
- **Foam Fill** – (If you are in the middle of a long project and get a hole in the trench shield, the foam will help keep the water out of the box so it doesn't become too heavy to pull or lift)
- **Extended spreader collars** – Add extended collars so you can use the same spreaders and achieve multiple spreader widths.
- **Cut Outs/Replaceable Doors** – If you are working on a project where there are manholes or structures with multiple pipes coming in & out, we can build a trench shield with cut outs for the pipe to run through the middle of your trench box.
- **Stacking Pockets** – We can add stacking pockets on the outside edges of the trench shield or inside of the wall for stacking with another Trench Shield.
- **Mud Plate Bracket/Mud Plate** – If you are trying to keep dirt from coming into the front of your trench shield, we offer different mud plate bracket configurations to meet your needs. (We will build it to fit your needs)
- **Knife Edge** – If you are trying to seal off the water to aid in coming in on the bottom, our knife edge boxes are very popular.
- **Flat Bottom** – Good as an all around stacking trench shield or for those that choose to not want a knife edge box.

- **Stacking Saddles** – For those that want the best of both worlds. Flat Bottom and Knife edge combined. Keep your knife edge for almost the entire length of the box, but we can offer 8" of a flat saddle on all four corners of the trench shield to make it good for stacking if you don't want your knife edge up in the air, when you are needing to push on it.
